

VAADIN FLOW

Java-based GUI web development with
Vaadin Flow

FEATURES

Java-based Development

Vaadin enables the development of complex web applications entirely in Java, without using HTML or JavaScript. It provides An architecture that lets you concentrate on the UI. No need to think about client-server communication.

Responsive User Interface

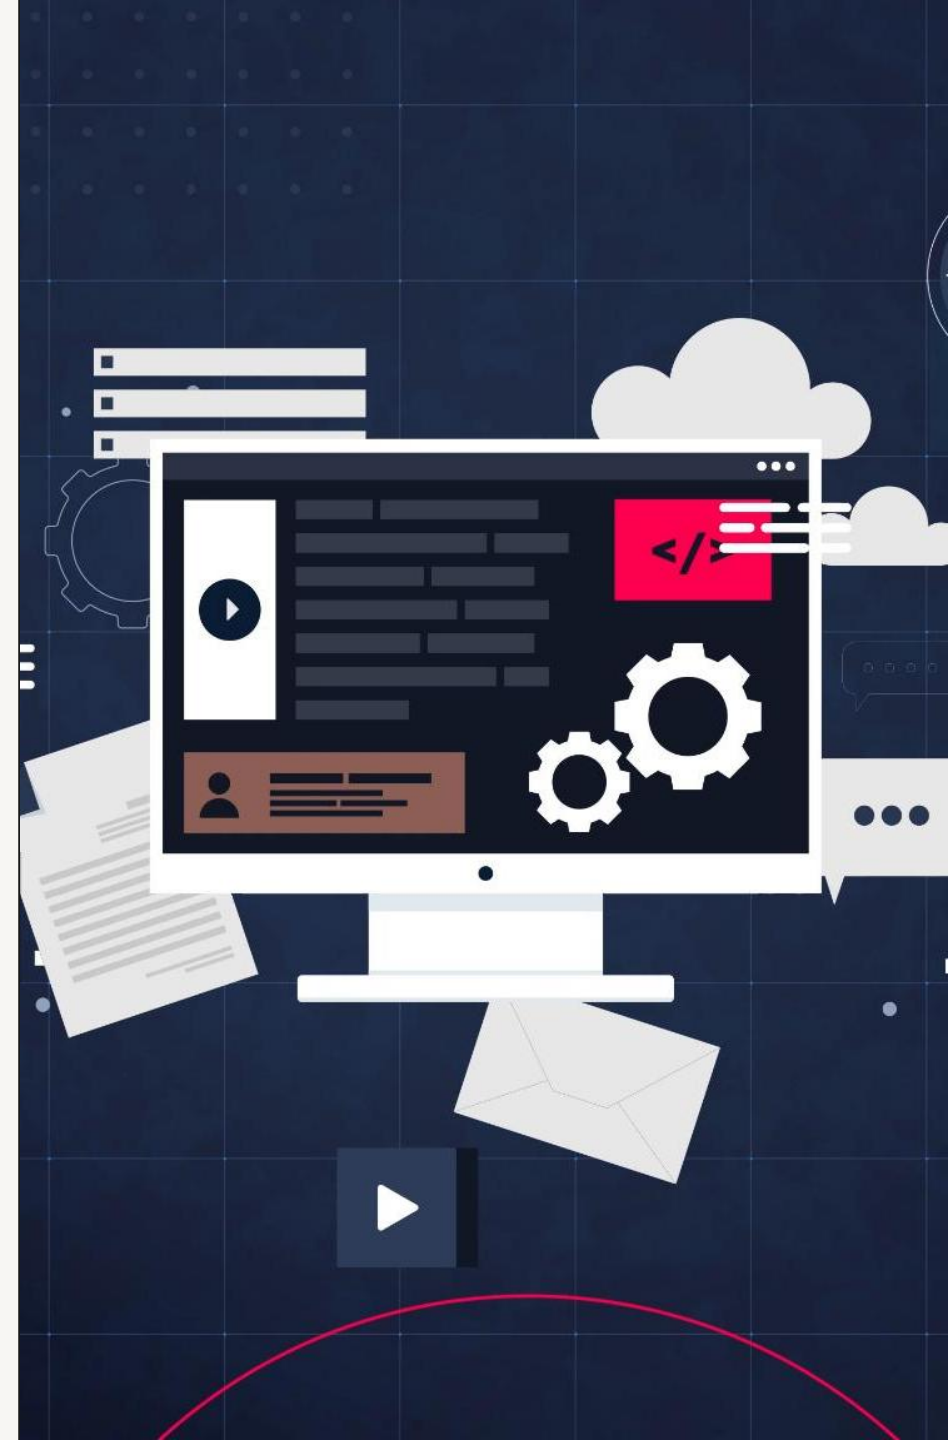

The user interface automatically adapts to different screen sizes for mobile and desktop applications.

Integrations

Vaadin supports Jetty, Quarkus, and Spring Boot with Maven and Gradle. In addition to Java, Kotlin is also supported.

Component Library

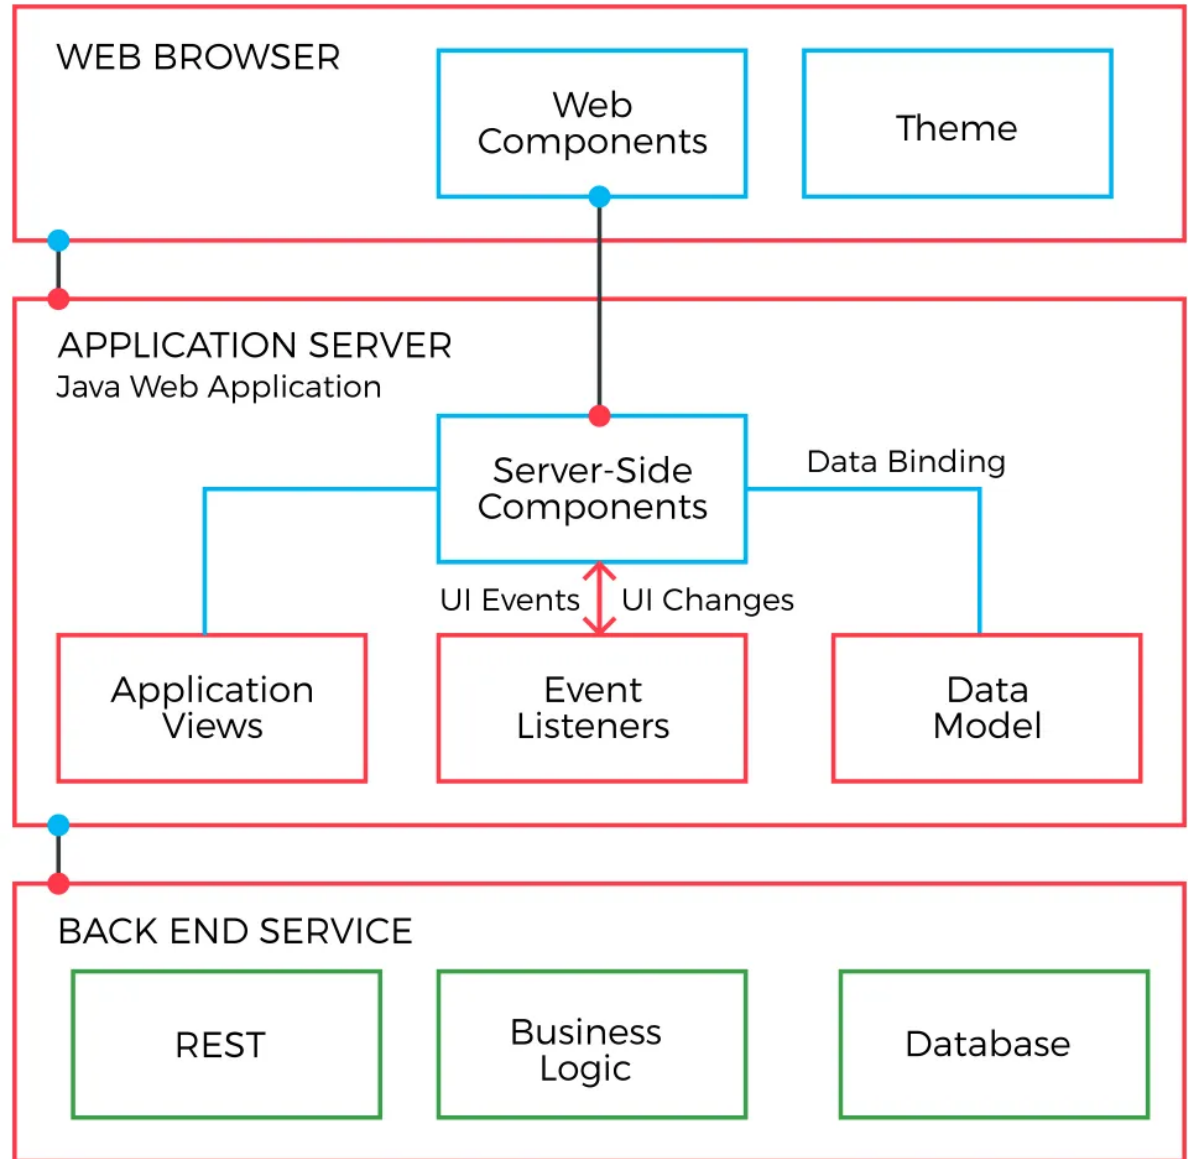

Ready-to-use UI elements are customizable, and automatic client-server synchronization ensures a smooth user experience.

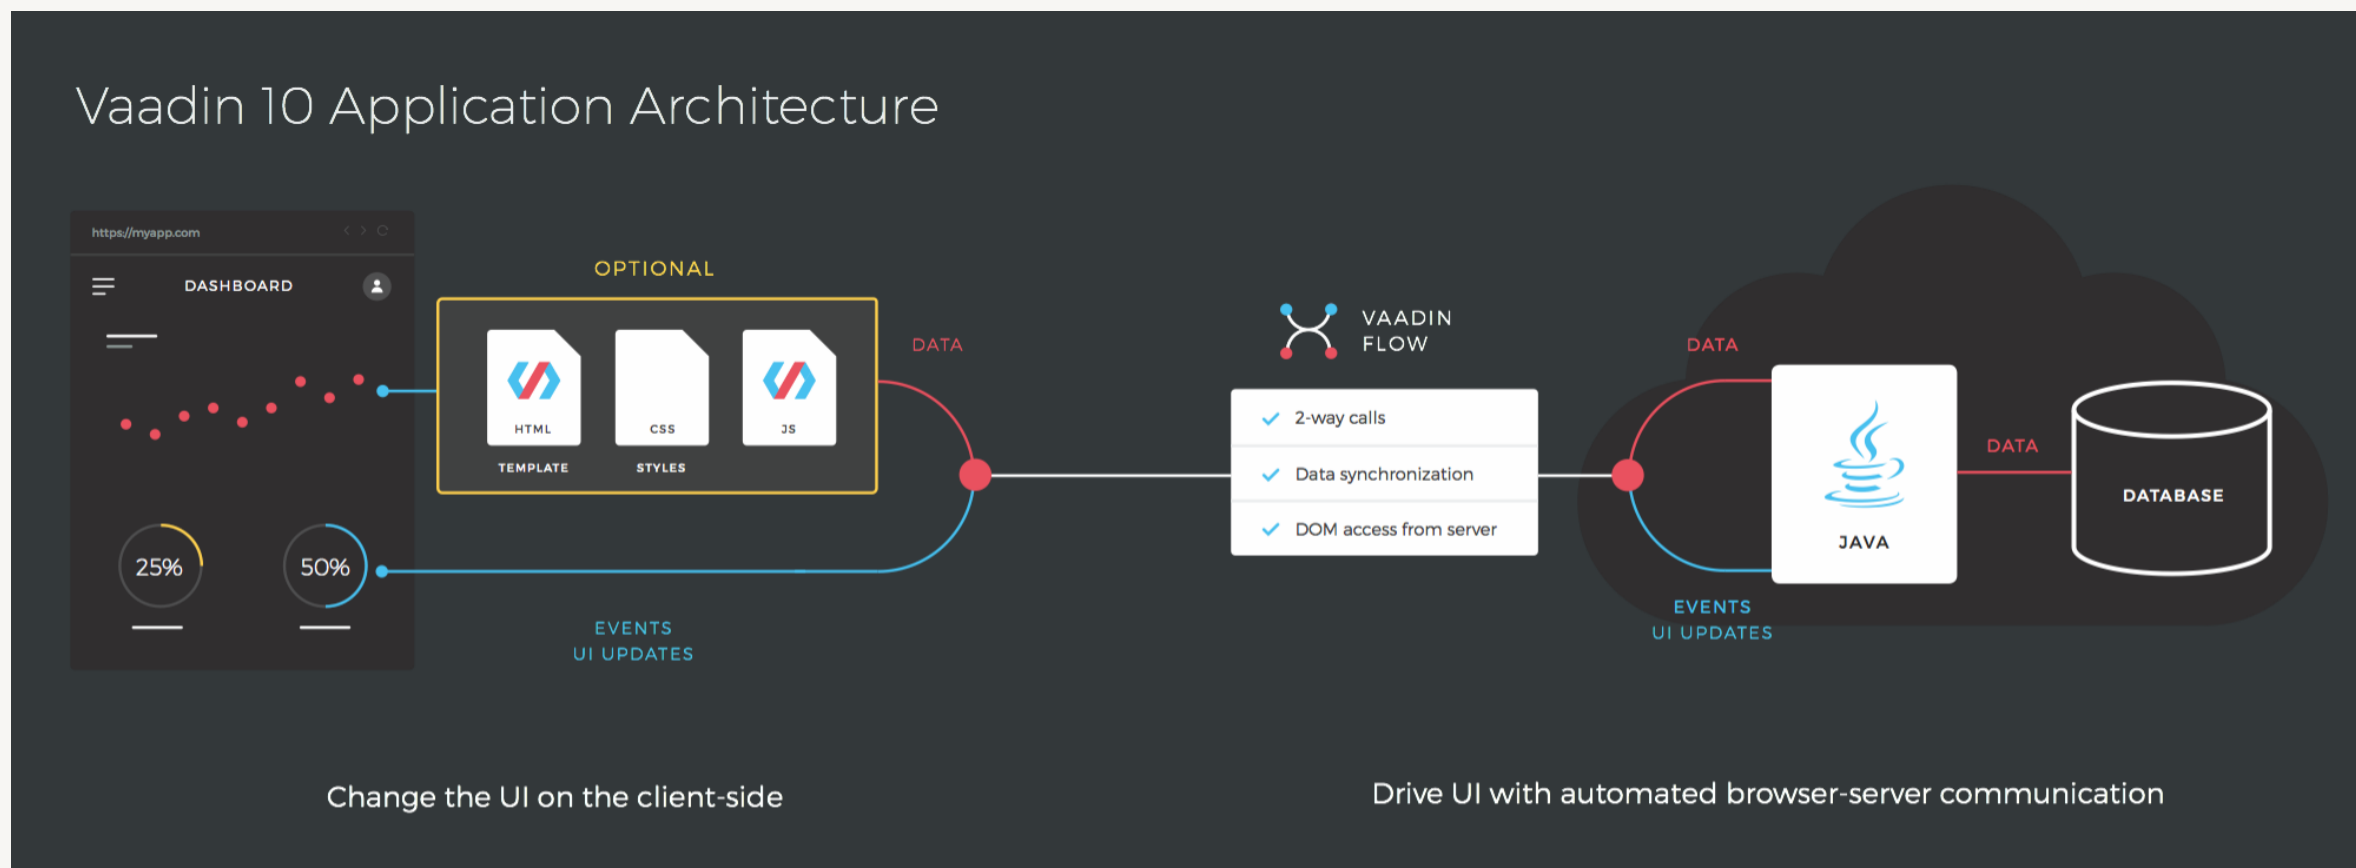

WHAT IS VAADIN FLOW?

Vaadin Flow is a framework that allows developers to write web applications completely in Java. Instead of writing HTML, CSS, and JavaScript, the user interface is constructed from UI components in Java — similar to how it's done with Swing and JavaFX. The HTML code, CSS style sheets, and JavaScripts are still there and accessible when needed
