

Machine Learning

Summary

What did we cover in this class?

♦ Supervised Learning

▪ Regression

- Linear Regression
- Polynomial Regression
- Lasso, Ridge, Elastic Net Regularization
- Regression Trees

▪ Classification

- Knn-Classification
- Bayes Classification (Optimal, Naïve)
- Decision Tree Classification (in all its variants)
- SVM
- ANN

▪ Boosting and Extreme Gradient Boosting for Classification and Regression

all about bias-variance tradeoff
what are adv disadv of these models
which one is the best fit for my use case

♦ Unsupervised Learning

▪ Clustering

- K-means
- EM

wie bilde ich meine objekte in den vektorraum
wenn die abbildung schlecht ist, dann versagt jegliches model

1. Introduction and kNN
2. Model Evaluation
3. Linear Regression
4. Advanced Regression
5. Optimal, Gaussian, NB Classifier
6. Decision Trees
7. SVM
8. (Artificial Neural Networks)
9. Boosting
10. XGBoost
11. Partitioning Clustering
12. GMM and EM

SVM: was macht der kernel? prinzip des kernel tricks verstanden haben

ensemble learning: bagging parallel und dann zusammenfügen durch z.b. majority vote oder durchschnittswert

boosting sequential, weitere modelle verbessern vorheriges ergebnis

stacking und blending sind bagging verfahren: paralleles training, blending ein schritt weiter als nur bagging (gewichtung und durchschnitt),

stacking trainiert ein weiteres modell, was die gewichtung pro datensatz trainiert und optimiert

blending und stacking nicht so populär, weil wenn man genug decision trees hat, dann hat das ähnlichen effekt

Summary of Core Concepts

- ♦ **Supervised vs. Unsupervised Learning**
- ♦ **Generalization – Underfitting vs. Overfitting and the Bias-Variance-Tradeoff**
- ♦ **Regularization – Controlling Overfitting**
 - ridge, lasso, elastic net (essentially penalizes large values for params)
 - inherent controlling via parameters of the given model
 - ensemble learning - e.g. shallow decision tree but many of them
 - i.e. small steps to control bias-variance
- ♦ **Ensemble Learning**
- ♦ **Evaluation Metrics and how to compute them**
- ♦ **Hyperparameters and how to tune them**
 - many models have default params that make no sense, always need to tune them
 - e.g. decision tree without tuning would massively go into overfitting
 - vs learning rate which has a sensible init value

Butterflies you should be able to recognize

01 Tagpfauenauge

02 Hauchel Bläuling

03 Schachbrett

04 Zitronenfalter

05 Schwalbenschwanz

06 Aurorafalter

07 Kleiner Fuchs

08 Kaisermantel

09 Taubenschwänzchen

10 Trauermantel

11 Admiral

12 C-Falter

**Thank you
for your active
participation**
