

Exercise 2

Backpropagation

Please answer the following questions based on the Video we just watched together.

- a) What are the three avenues you have available to nudge the activation of a neuron in the direction you want it to move?
- b) Which weights have the strongest influence on the activation of a neuron? What "rule" to change the weights can you infer from this?
- c) Similarly, to the last question, what is the rule for changing the activations?
- d) Explain the idea of stochastic gradient descent - what does it do and why? Make sure to include the concept of "mini batches" in your explanation.
